

# MANDATORY COMPOSTING

An important part of California's efforts to protect the environment is to increase the diversion of organic materials away from landfills and toward the production of value-added products such as compost, fertilizers, and biofuels. Compost, made from a mixture of food and yard wastes that have been fully decomposed, can fertilize and condition soil.

Compost is a key to healthy soil, and healthy soil is critical to reducing carbon in the air.

Keeping recyclable and compostable materials out of the garbage is an excellent first step toward cost savings and improved operational efficiency.
